Doc. # PS7JAxx7258xxx-LF ■ Revision D ■

Features

- JEDEC standard Power Supply
 - VDD = VDDQ = 1.5V ±0.075V
 - VDDSPD = +3.0V to +3.6V
- 244pin Mini registered Dual-In-Line Memory Module with parity bit for address and control bus.
- 8 Internal Banks.
- Programmable CAS Latency: 6, 7, 8, 9, 10, 11
- Programmable CAS Write Latency (CWL).
- Programmable Additive Latency (Posted CAS).
- Fixed burst chop (BC) of 4 and burst length (BL) of 8 via the mode register set (MRS)
- Selectable BC4 or BL8 on-the-fly (OTF)
- On-Die-Termination (ODT) and Dynamic ODT for improved signal integrity.
- Refresh. Self Refresh and Power Down Modes.
- ZQ Calibration for output driver and ODT.
- System Level Timing Calibration Support via Write Leveling and Multi Purpose Register (MPR) Read Pattern.
- Serial Presence Detect with EEPROM.
- On-DIMM Thermal Sensor.
- Asynchronous Reset.
- Mini RDIMM dimensions: 82 mm x 30 mm.
- RoHS Compliant* (see last page)

Nomenclature

Module Standard	SDRAM Standard	Clock
PC3-6400	DDR3-800	400MHz
PC3 -8500	DDR3-1066	533MHz
PC3-10600	DDR3-1333	667MHz
PC3-12800	DDR3-1600	800MHz

PIN FUNCTION DESCRIPTION

SYMBOL	TYPE	POLARITY	DESCRIPTION
CK0	IN	Positive Edge	Positive line of the differential pair of system clock inputs that drives input to the on-DIMM Clock Driver.
CK0#	IN	Negative Edge	Negative line of the differential pair of system clock inputs that drives the input to the on-DIMM Clock Driver.
CKE[1:0]	IN	Active High	CKE HIGH activates, and CKE LOW deactivates internal clock signals, and device input buffers and output drivers of the SDRAMs. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER DOWN (row ACTIVE in any bank)
S[3:0]#	IN	Active Low	Enables the associated SDRAM command decoder when low and disables decoder when high. When decoder is disabled, new commands are ignored and previous operations continue. These input signals also disable all outputs (except CKE and ODT) of the register(s) on the DIMM when both inputs are high. When both S[1:0] are high, all register outputs (except CKE, ODT and Chip select) remain in the previous state. For modules supporting 4 ranks, S[3:2] operate similarly to S[1:0] for a second set of register outputs.
ODT[1:0]	IN	Active High	On-Die Termination control signals
RAS#, CAS#, WE#	IN	Active Low	When sampled at the positive rising edge of the clock, CAS#, RAS#, and WE# define the operation to be executed by the SDRAM.
VREFDQ	Supply		Reference voltage for DQ0-DQ63 and CB0-CB7.
VREFCA	Supply		Reference voltage for A0-A15, BA0-BA2, RAS#, CAS#, WE#, S0#, S1#, CKE0, CKE1, Par_In, ODT0 and ODT1.
BA[2:0]	IN	-	Selects which SDRAM bank of eight is activated. BA0 - BA2 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines mode register is to be accessed during an MRS cycle.
A[15:13, 12/BC, 11, 10/AP, 9:0]	IN	-	Provided the row address for Active commands and the column address and Auto Precharge bit for Read/Write commands to select one location out of the memory array in the respective bank. A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA. A12 is also utilized for BL 4/8 identification for "BL on the fly" during CAS# command. The address inputs also provide the op-code during Mode Register Set commands.
DQ [63:0], CB [7:0]	I/O	-	Data and Check Bit Input/Output pins
VDD, VSS	Supply	-	Power and ground for the DDR SDRAM input buffers and core logic.
DM [8:0]	IN	Active High	Masks write data when high, issued concurrently with input data.
VDD, VSS	Supply		Power and ground for the DDR SDRAM input buffers and core logic.
VTT	Supply		Termination Voltage for Address/Command/Control/Clock nets.
DQS[17:0]	I/O	Positive Edge	Positive line of the differential data strobe for input and output data.
DQS [17:0]#	I/O	Negative Edge	Negative line of the differential data strobe for input and output data.
TDQS[17:9], TDQS[17:9]#	OUT		TDQS, TDQS# is applicable for X8 DRAMs only. When enabled via Mode Register A11=1 in MR1, DRAM will enable the same termination resistance function on TDQS, TDQS# that is applied to DQS, DQS#. When disabled via mode register A11=0 in MR1, DM, TDQS will provide the data mask function and TDQS# is not used. X4/X16 DRAMs must disable the TDQS function via mode register A11=0 in MR1
SA [2:0]	IN	-	These signals are tied at the system planar to either VSS or VDDSPD to configure the serial SPD EEPROM address range.
SDA	I/O	-	This bidirectional pin is used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus line to VDDSPD on the system planar to act as a pull-up.
SCL	IN	-	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus time to VDDSPD on the system planar to act as a pull-up.

PIN FUNCTION DESCRIPTION

SYMBOL	TYPE	POLARITY	DESCRIPTION
EVENT#	OUT (open drain)	Active Low	This signal indicates that a thermal event has been detected in the thermal sensing device. The system should guarantee the electrical level requirement is met for the EVENT pin on TS/SPD part.
VDDSPD	Supply	-	Serial EEPROM positive power supply wired to a separate power pin at the connector which supports from 3.0 Volt to 3.6 Volt (nominal 3.3V) operation.
RESET#	IN		The RESET pin is connected to the RST pin on the register and to the OE pin on the PLL. When low, all register outputs will be driven low and the PLL clocks to the DRAMs and register(s) will be set to low level (the PLL will remain synchronized with the input clock)
Par_In	IN		Parity bit for the Address and Control bus. ("1 ": Odd, "0 ": Even)
Err_Out#	OUT		Parity error found in the Address and Control bus
TEST			Used by memory bus analysis tools (unused (NC) on memory DIMMs)

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Voltage on any pin relative to GND	Vin, Vout	-0.4 ~ 1.975	V
Voltage on VDD supply relative to GND	VDD	-0.4 ~ 1.975	V
Voltage on VDDQ supply relative to GND	VDDQ	-0.4 ~ 1.975	V
Storage temperature	TSTG	-55 ~ +100	°C

Note: Permanent device damage may occur if 'ABSOLUTE MAXIMUM RATINGS' are exceeded. Functional operation should be restricted to recommended operating condition. Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

DC OPERATING CONDITIONS AND CHARACTERISTICS (SSTL_1.5)

Recommended operating conditions (Voltages referenced to GND, Tcase = 0 to 85°C)

Parameter	Symbol	Min.	Max.	Unit	Notes
Case Temperature	Tcase	0	95	°C	5
Supply voltage	VDD	1.425	1.575	V	1, 2
Supply voltage for DQ, DQS	VDDQ	1.425	1.575	V	1, 2
Reference Voltage for DQ, DM inputs	VREFDQ(DC)	0.49 x VDD	0.51 x VDD	V	3, 4
Reference Voltage for ADD, CMD inputs	VREFCA(DC)	0.49 x VDD	0.51 x VDD	V	3, 4
Terminal Voltage	VTT	0.49 x VDD	0.51 x VDD	V	3, 4
EEPROM Supply Voltage	VDDSPD	1.7	3.6	V	
Input high voltage	VIH(AC)	VREF + 0.175	-	V	
	VIH(DC)	VREF + 0.100	VDD		
Input low voltage	VIL(AC)	-	VREF - 0.175	V	
	VIL(DC)	VSS	VREF - 0.100		
Input leakage current	Single Rank	IIL	-41	41	µA
Output leakage current	Single Rank	IOL	-10	10	µA

Note:

- VDDQ tracks with VDD. AC parameters are measured with VDD and VDDQ tied together
- Under all conditions VDDQ must be less than or equal to VDD.
- The ac peak noise on VREF may not allow VREF to deviate from VREF.DC by more than ±1% VDD (for reference: approx. ± 15 mV).
- For reference: approx. VDD/2 ± 15 mV.
- Refresh rate required to be doubled (tREFI = 3.9µs) when 85°C < TC < 95°C.

DEVICE CAPACITANCE

Parameter	Symbol	DDR3-800		DDR3-1066		DDR3-1333		Units	Notes
		Min	Max	Min	Max	Min	Max		
Input/output capacitance (DQ, DM, DQS, DQS#, TDQS,TDQS#)	CIO	1.5	3.0	1.5	2.7	1.5	2.5	pF	1,2,3
Input capacitance, CK and CK#	CCK	0.8	1.6	0.8	1.6	0.8	1.4	pF	2,3
Input capacitance delta, CK and CK#	CDCK	0	0.15	0	0.15	0	0.15	pF	2,3,4
Input/output capacitance delta DQS and DQS#	CDDQS	0	0.2	0	0.2	0	0.15	pF	2,3,5
Input capacitance, (CTRL, ADD, CMD input-only pins)	CI	0.75	1.4	0.75	1.35	0.75	1.3	pF	2,3,6
Input/output capacitance of ZQ pin	CZQ	-	3	-	3	-	3	pF	2,3,7

DEVICE CAPACITANCE (Cont.)

Parameter	Symbol	DDR3-1600		DDR3-1866		Min	Max	Units	Notes
		Min	Max	Min	Max				
Input/output capacitance (DQ, DM, DQS, DQS#, TDQS,TDQS#)	CIO	1.5	2.3	1.4	2.2			pF	1,2,3
Input capacitance, CK and CK#	CCK	0.8	1.4	0.8	1.3			pF	2,3
Input capacitance delta, CK and CK#	CDCK	0	0.15	0	0.15			pF	2,3,4
Input/output capacitance delta DQS and DQS#	CDDQS	0	0.15	0	0.15			pF	2,3,5
Input capacitance, (CTRL, ADD, CMD input-only pins)	CI	0.75	1.3	0.75	1.2			pF	2,3,6
Input/output capacitance of ZQ pin	CZQ	-	3	-	3			pF	2,3,7

Note:

1. Although the DM, TDQS and TDQS# pins have different functions, the loading matches DQ and DQS
2. This parameter is not subject to production test. It is verified by design and characterization. The capacitance is measured according to JEP147 ("PROCEDURE FOR MEASURING INPUT CAPACITANCE USING A VECTOR NETWORK ANALYZER(VNA)") with VDD, VDDQ, VSS, VSSQ applied and all other pins floating (except the pin under test, CKE, RESET# and ODT as necessary). VDD=VDDQ=1.5V, VBIAS=VDD/2 and on die termination off.
3. This parameter applies to monolithic devices only; stacked/dual-die devices are not covered here
4. Absolute value of CCK-CCK#
5. Absolute value of CIO(DQS)-CIO(DQS#)
6. CI applies to ODT, CS#, CKE, A0-A15, BA0-BA2, RAS#, CAS#, WE#.
7. Maximum external load capacitance on ZQ pin: 5 pF.

IDD CURRENT

DC CHARACTERISTICS DEFINITIONS (Recommended operating conditions unless otherwise noted, Tcase = 0 to 85 °C)

Symbol	Conditions	Units	Notes
IDD0	Operating one bank active-precharge current; tCK = tCK(IDD), tRC = tRC(IDD), tRAS = tRASmin(IDD); CKE is HIGH, CS is HIGH between valid commands; Address bus inputs are SWITCHING; Data bus inputs are SWITCHING	mA	1, 2
IDD1	Operating one bank active-read-precharge current; IOUT = 0mA; BL = 8, CL = CL(IDD), AL = 0; tCK = tCK(IDD), tRC = tRC(IDD), tRAS = tRASmin(IDD), tRCD = tRCD(IDD); CKE is HIGH, CS is HIGH between valid commands; Address bus inputs are SWITCHING; Data pattern is same as IDD4W	mA	1, 2
IDD2P-S	Precharge power-down current (slow exit); All banks idle; tCK = tCK(IDD); CKE is LOW; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING	mA	1, 3
IDD2P-F	Precharge power-down current (fast exit); All banks idle; tCK = tCK(IDD); CKE is LOW; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING	mA	1, 3
IDD2Q	Precharge quiet standby current; All banks idle; tCK = tCK(IDD); CKE is HIGH, CS is HIGH; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING	mA	1, 3
IDD2N	Precharge standby current; All banks idle; tCK = tCK(IDD); CKE is HIGH, CS is HIGH; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING	mA	1, 3
IDD3P	Active power-down current; All banks open; tCK = tCK(IDD); CKE is LOW; Other control and address bus inputs are STABLE; Data bus inputs are FLOATING	mA	1, 3
IDD3N	Active standby current; All banks open; tCK = tCK(IDD), tRAS = tRASmax(IDD), tRP = tRP(IDD); CKE is HIGH, CS is HIGH between valid commands; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING	mA	1, 3
IDD4W	Operating burst write current; All banks open, Continuous burst writes; BL = 8, CL = CL(IDD), AL = 0; tCK = tCK(IDD), tRAS = tRASmax(IDD), tRP = tRP(IDD); CKE is HIGH, CS is HIGH between valid commands; Address bus inputs are SWITCHING; Data bus inputs are SWITCHING	mA	1, 2
IDD4R	Operating burst read current; All banks open, Continuous burst reads, IOUT = 0mA; BL = 8, CL = CL(IDD), AL = 0; tCK = tCK(IDD), tRAS = tRAS-max(IDD), tRP = tRP(IDD); CKE is HIGH, CS is HIGH between valid commands; Address bus inputs are SWITCHING; Data pattern is same as IDD4W	mA	1, 2
IDD5B	Burst refresh current; tCK = tCK(IDD); Refresh command at every tRFC(IDD) interval; CKE is HIGH, CS is HIGH between valid commands; Other control and address bus inputs are SWITCHING; Data bus inputs are SWITCHING	mA	1, 3
IDD6	Self refresh current; CK and CK at 0V; CKE ≤ 0.2V; Other control and address bus inputs are FLOATING; Data bus inputs are FLOATING	mA	1, 3
IDD6ET	Extended Temperature Range Self-Refresh Current; CK and CK at 0V; CKE ≤ 0.2V; Other control and address inputs are FLOATING; Data Bus inputs are FLOATING, PASR disabled, Applicable for MR2 setting A6=0 and A7=1	mA	1, 3
IDD7	Operating bank interleave read current; All bank interleaving reads, IOUT = 0mA; BL = 8, CL = CL(IDD), AL = tRCD(IDD)-1*tCK(IDD); tCK = tCK(IDD), tRC = tRC(IDD), tRRD = tRRD(IDD), tRCD = 1*tCK(IDD); CKE is HIGH, CS is HIGH between valid commands; Address bus inputs are STABLE during DESELECTs; Data pattern is same as IDD4R;	mA	1, 2

Notes:

- 1) Calculated values are from component data.
- 2) One module rank in the active IDD; the other rank in IDD2P-S (slow exit)
- 3) All ranks in this IDD condition.

REGISTERING CLOCK DRIVER SPECIFICATIONS

SSTE82882 or equivalent

Symbol	Parameter	Pins	Min	Nom	Max	Units
VDD	DC supply voltage	–	1.425	1.5	1.575	V
VREF	DC reference voltage	–	0.49 × VDD	0.5 × VDD	0.51 × VDD	V
VTT	DC termination voltage	–	VREF – 40 mV	VREF	VREF + 40 mV	V
VIH(AC)	AC high-level input voltage	Control, command, address	VREF + 175mV	–	VDD + 0.4	V
VIL(AC)	AC low-level input voltage	Control, command, address	–0.4	–	VREF - 175mV	V
VIH(DC)	DC high-level input voltage	Control, command, address	VREF + 100mV	–	VDD + 0.4	V
VIL(DC)	DC low-level input voltage	Control, command, address	–0.4	–	VREF - 100mV	V
VIH (CMOS)	High-level input voltage	RESET#, MIRROR	0.65 × VDD	–	VDD	V
VIL (CMOS)	Low-level input voltage	RESET#, MIRROR	0	–	0.35 × VDD	V
VIX(AC)	Differential input crosspoint voltage range	CK, CK#, FBIN, FBIN#	0.5 × VDD - 175mV	0.5 × VDD	0.5 × VDD + 175mV	V
VID(AC)	Differential input voltage	CK, CK#	350	–	VDD + TBD	mV
IOH	High-level output current	FBOUT, FBOUT#	–	–	11	mA
IOL	Low-level output current	ERR_OUT#	25	28	TBD	mA

Notes: Timing and switching specifications for the register are critical for proper operation of the DDR3 SDRAM RDIMMs. These are meant to be a subset of the parameters for the specific device used on the module.

Speed Bin Table Notes

1. Absolute Specification (TOPER; VDDQ = VDD = 1.5V +/- 0.075 V);
2. The CL setting and CWL setting result in tCK(AVG).MIN and tCK(AVG).MAX requirements. When making a selection of tCK(AVG), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.
3. tCK(AVG).MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(AVG) value (3.0, 2.5, 1.875, 1.5, 1.25, 1.07, or 0.935 ns) when calculating CL [nCK] = tAA [ns] / tCK(AVG) [ns], rounding up to the next 'Supported CL', where tCK(AVG) = 3.0 ns should only be used for CL = 5 calculation.
4. tCK(AVG).MAX limits: Calculate tCK(AVG) = tAA.MAX / CL SELECTED and round the resulting tCK(AVG) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.5 ns or 1.25 ns or 1.07 ns or 0.935 ns). This result is tCK(AVG).MAX corresponding to CL SELECTED.
5. 'Reserved' settings are not allowed. User must program a different value.
6. 'Optional' settings allow certain devices in the industry to support this setting; however, it is not a mandatory feature. Refer to supplier's data sheet and/or the DIMM SPD information if and how this setting is supported.
7. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
8. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
9. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
10. For devices supporting optional down binning to CL=7 and CL=9, tAA/tRCD/tRPmin must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3-1333H devices supporting down binning to DDR3-1066F should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600K devices supporting down binning to DDR3-1333H or DDR3-1066F should program 13.125 ns in SPD bytes for tAAmin (Byte16), tRCDmin (Byte 18), and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21, 23) also should be programmed accordingly. For example, 49.125ns (tRASmin + tRPmin = 36 ns + 13.125 ns) for DDR3-1333H and 48.125ns (tRASmin + tRPmin = 35 ns + 13.125 ns) for DDR3-1600K.

Doc. # PS7JAx7258xxx-LF ■ Revision D ■

18.1 Jitter Notes

1. Unit 'tCK(avg)' represents the actual tCK(avg) of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges.ex) tMRD = 4 [nCK] means; if one Mode Register Set command is registered at Tm, another Mode Register Set command may be registered at Tm+4, even if (Tm+4 - Tm) is 4 x tCK(avg) + tERR(4per),min.
2. These parameters are measured from a command/address signal (CKE, CS, RAS, CAS, WE, ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK/CK) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
3. These parameters are measured from a data strobe signal (DQS(L/U), DQS(L/U)) crossing to its respective clock signal (CK, CK) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
4. These parameters are measured from a data signal (DM(L/U), DQ(L/U)0, DQ(L/U)1, etc.) transition edge to its respective data strobe signal (DQS(L/U), DQS(L/U)#) crossing. Specific Note e For these parameters, the DDR3 SDRAM device supports $t_nPARAM [nCK] = RU\{ tPARAM [ns] / tCK(avg) [ns] \}$, which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support $t_nRP = RU\{tRP / tCK(avg)\}$, which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3-800 6-6-6, of which tRP = 15ns, the device will support $t_nRP = RU\{tRP / tCK(avg)\} = 6$, as long as the input clock jitter specifications are met, i.e. Precharge command at Tm and Active command at Tm+6 is valid even if (Tm+6 - Tm) is less than 15ns due to input clock jitter.
5. When the device is operated with input clock jitter, this parameter needs to be derated by the actual tERR(mper),act of the input clock, where $2 \leq m \leq 12$. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR3-800 SDRAM has tERR(mper),act,min = - 172 ps and tERR(mper),act,max = + 193 ps, then $tDQSCK,min(derated) = tDQSCK,min - tERR(mper),act,max = - 400 ps - 193 ps = - 593 ps$ and $tDQSCK,max(derated) = tDQSCK,max - tERR(mper),act,min = 400 ps + 172 ps = + 572 ps$. Similarly, tLZ(DQ) for DDR3-800 derates to $tLZ(DQ),min(derated) = 800 ps - 193 ps = - 993 ps$ and $tLZ(DQ),max(derated) = 400 ps + 172 ps = + 572 ps$. (Caution on the min/max usage!) Note that tERR(mper),act,min is the minimum measured value of tERR(nper) where $2 \leq n \leq 12$, and tERR(mper),act,max is the maximum measured value of tERR(nper) where $2 \leq n \leq 12$.
6. When the device is operated with input clock jitter, this parameter needs to be derated by the actual tJIT(per),act of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR3-800 SDRAM has tCK(avg),act = 2500 ps, tJIT(per),act,min = - 72 ps and tJIT(per),act,max = + 93 ps, then $tRPRE,min(derated) = tRPRE,min + tJIT(per),act,min = 0.9 \times tCK(avg),act + tJIT(per),act,min = 0.9 \times 2500 ps - 72 ps = + 2178 ps$. Similarly, $tQH,min(derated) = tQH,min + tJIT(per),act,min = 0.38 \times tCK(avg),act + tJIT(per),act,min = 0.38 \times 2500 ps - 72 ps = + 878 ps$. (Caution on the min/max usage!)

Doc. # PS7JAx7258xxx-LF ■ Revision D ■

18.2 Timing Parameter Notes

1. Actual value dependant upon measurement level definitions which are TBD.
2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
3. The max values are system dependent.
4. WR as programmed in mode register
5. Value must be rounded-up to next higher integer value
6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, tREFI.
7. For definition of RTT turn-on time tAON see "Device Operation"
8. For definition of RTT turn-off time tAOF see "Device Operation".
9. tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR / tCK to the next integer.
10. WR in clock cycles as programmed in MR0
11. The maximum read postamble is bound by tDQSCK(min) plus tQSH(min) on the left side and tHZ(DQS)max on the right side. Device Operation.
12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by TBD
13. Value is valid for RON34
14. Single ended signal parameter.
15. tREFI depends on TOPER
16. tIS(base) and tIH(base) values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK, CK differential slew rate, Note for DQ and DM signals, VREF(DC) = VREFDQ(DC). For input only pins except RESET, VREF(DC)=VREFCA(DC). See "Address/ Command Setup, Hold and Derating"
17. tDS(base) and tDH(base) values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, DQS differential slew rate. Note for DQ and DM signals, VREF(DC)= VREFDQ(DC). For input only pins except RESET, VREF(DC)=VREFCA(DC). See "Data Setup, Hold and Slew Rate Derating"
18. Start of internal write transaction is defined as follows ;
For BL8 (fixed by MRS and on-the-fly) : Rising clock edge 4 clock cycles after WL.
For BC4 (on-the-fly) : Rising clock edge 4 clock cycles after WL
For BC4 (fixed by MRS) : Rising clock edge 2 clock cycles after WL
19. The maximum read preamble is bound by tLZDQS(min) on the left side and tDQSCK(max) on the right side. See "Device Operation"
20. CKE is allowed to be registered low while operations such as row activation, precharge, autoprecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
21. Although CKE is allowed to be registered LOW after a REFRESH command once tREFPDEN(min) is satisfied, there are cases where additional time such as tXPDLL(min) is also required. See "Device Operation".
22. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.
23. One ZQCS command can effectively correct a minimum of 0.5 % (ZQCorrection) of RON and RTT impedance error within 64 nCK for all speed bins assuming the maximum sensitivities specified in the 'Output Driver Voltage and Temperature Sensitivity' and 'ODT Voltage and Temperature Sensitivity' tables. The appropriate interval between ZQCS commands can be determined from these tables and other application specific parameters. One method for calculating the interval between ZQCS commands, given the temperature (Tdriftrate) and voltage (Vdriftrate) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:

$$\frac{ZQCorrection}{(TSens \times Tdriftrate) + (VSens \times Vdriftrate)}$$

where TSens = max(dRTTdT, dRONdTM) and VSens = max(dRTTdV, dRONdVM) define the SDRAM temperature and voltage sensitivities.

For example, if TSens = 1.5% /°C, VSens = 0.15% / mV, Tdriftrate = 1°C / sec and Vdriftrate = 15 mV / sec, then the interval between ZQCS commands is calculated as:

$$\frac{0.5}{(1.5 \times 1) + (0.15 \times 15)} = 0.133 \sim 128ms$$

24. n = from 13 cycles to 50 cycles. This row defines 38 parameters.
25. tCH(abs) is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.
26. tCL(abs) is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.
27. The tIS(base) AC150 specifications are adjusted from the tIS(base) specification by adding an additional 100 ps of derating to accommodate for the lower alternate threshold of 150 mV and another 25 ps to account for the earlier reference point [(175 mv - 150 mV) / 1 V/ns].
28. Pulse width of a input signal is defined as the width between the first crossing of VREF(DC) and the consecutive crossing of VREF(DC)
29. tDQSL describes the instantaneous differential input low pulse width on DQS-DQS, as measured from one falling edge to the next consecutive rising edge.
30. tDQSH describes the instantaneous differential input high pulse width on DQS-DQS, as measured from one rising edge to the next consecutive falling edge.
31. tDQSH, act + tDQSL, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.
32. tDSH, act + tDSS, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.

REVISION HISTORY

Revision	Release Date	Description of Change	Checked By (Full Name)
X1	May 7, 2008	Preliminary release	Brian Ouellette
X2	July 2, 2008	Update to latest proposed pin out.	Brian Ouellette
X3	July 2, 2008	Correction to 244 pin under features	Brian Ouellette
X4	June 5, 2009	Add 2Gb 2R configurations	Brian Ouellette
A	July 13, 2009	Remove Preliminary watermark	Brian Ouellette
B	August 25, 2009	Add PC3-12800 configurations	Brian Ouellette
B1	January 19, 2010	Add AC tables	Brian Ouellette
B2	October 28, 2010	Correct TDQS, TDQS# pin description	Brian Ouellette
B3	May 31, 2011	Added 8GB PN's and updated IDD table for 4Gbit DRAM.	
B4	November 7, 2011	Added new logo and company name	
B5	February 7, 2012	Removed Preliminary from DDR1600 PN's that use the 1250PCB. Updated theDDR3-1600 IDD tables, Speed Bins, Operating Conditions and timing parameters.	
B6	September 17, 2012	Removed PN with CL8, CL10. Added 1 rank 4gbit based VR7JA127258HB* PN's and IDD table	
B7	November 17, 2012	Updated the 2 rank mechanical drawing to match assembly drawing A001784b	
B8	July 20, 2013	Revised mechanical drawing to show dimension in mm and a nominal thickness with tolerance. Added a missing component to dual rank mechanical drawing	
B9	12-Dec-13	Revised the tRFC for 4Gb from 300ns to 260ns	Chanhee Park
C	September 16, 2015	Add 16GB part numbers and IDD values	
D	July 20, 2017	Revise logo. Change company address	

STATEMENT OF COMPLIANCE

Viking Technology (tm), Sanmina Corporation ("Viking") shall use commercially reasonable efforts to provide components, parts, materials, products and processes to Customer that do not contain: (i) lead, mercury, hexavalent chromium, polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE) above 0.1% by weight in homogeneous material or (ii) cadmium above 0.01% by weight of homogeneous material, except as provided in any exemption(s) from RoHS requirements (including the most current version of the "Annex" to Directive 2002/95/EC of 27 January, 2003), as codified in the specific laws of the EU member countries. Viking strives to obtain appropriate contractual protections from its suppliers in connection with the RoHS Directives.

All printed circuit boards (PCBs) have a flammability rating of UL94V-0.
