

DDR4 ECC SOUDIMM VR9FUxx72x8xxx

The Viking DDR4 SOUDIMM memory module offers lower operating voltages, higher module densities and faster speed categories than the prior DDR3 generation. JEDEC DDR4 (JESD79-4) has been defined to provide higher performance, with improved reliability and reduced power, thereby representing a significant achievement relative to previous DRAM memory technologies.

REVISION HISTORY

Revision	Release Date	Description of Change	Checked By (Full Name)
A	2/2/15	Initial release	Varadharajan Natarajan
B	3/29/15	Revise CAS Latency Addressing table for 4Gb Key timing parameters for 2400Mt/s speed. IDD/IPP values. Updated 8Gb Device IDD values. Change in page size. correct Min & Max values that were swapped. changes in values @ CWL -9. change in value for 2400 timing parameters	Varadharajan Natarajan
C	5/13/15	Revise block diagram	Chanhee Park
D	10/5/16	Revise logo and color scheme. Change VDD SPD can be from 2.2V to 3.6V	
E	4/23/18	Add 2666 PNs (4/26/18) Add DDR4-2666 Speed Bins and Operating Conditions. Update Timing Parameters by Speed Grade for 2666 speed. (5/23/18)

STATEMENT OF COMPLIANCE

Viking Technology, Sanmina Corporation ("Viking") shall use commercially reasonable efforts to provide components, parts, materials, products and processes to Customer that do not contain: (i) lead, mercury, hexavalent chromium, polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE) above 0.1% by weight in homogeneous material or (ii) cadmium above 0.01% by weight of homogeneous material, except as provided in any exemption(s) from RoHS requirements (including the most current version of the "Annex" to Directive 2002/95/EC of 27 January, 2003), as codified in the specific laws of the EU member countries. Viking strives to obtain appropriate contractual protections from its suppliers in connection with the RoHS Directives.

All printed circuit boards (PCBs) have a flammability rating of UL94V-0.

Notes:

- For part numbers containing a lowercase x, contact Viking for the full PN.
- The lowercase letters y and z are wildcard characters that indicate DRAM vendor and die revisions and /or for customer specific locked BOMs. Refer to the Viking part number coversheet for details.

Datasheet	4/26/2018
PS9FUxx72x8xxx	Viking Technology
Revision E	Page 4 of 41

Features

- JEDEC Standard Power Supply
 - VDD = VDDQ = 1.2V± 5% (1.14V-1.26V)
 - External VPP = 2.5 Volt +10%, -5%
 - VDDSPD = 2.2V to 3.6V Volts
- 260 pin Small Outline Dual-In-Line Memory Module
- Edge finger connector ramp zone to reduce insertion force
- Point-to-Point topology to reduce loading
- Pseudo-open drain (POD12) DQ lines
- Internally generated VrefDQ
- ECC recovery from command and parity errors
- On-chip CA Parity detection for the command/address bus
- Programmable CAS Latency: 13, 15, 17
- Programmable CAS Write Latency (CWL).
- Programmable Additive Latency (Posted CAS)
- Per DRAM addressability is supported
- Data Bus Inversion support for x8 devices
- Selectable Fixed burst chop (BC4) of 4 and burst length (BL8) of 8 on-the-fly (OTF) via the mode register set (MRS)
- 8n prefetch with 2 or 4 selectable bank groups: 16 banks (4 bank groups x 4 banks per bank group)
- Separate activation, read, write, refresh operations for each bank group
- 7 mode registers
- Dynamic On-Die-Termination (ODT) and ODT Park for improved signal integrity.
- Self Refresh and several Power Down Modes
- DLL-off mode for power savings
- System Level Timing Calibration Support via Write Leveling and Multi Purpose Register (MPR) Read Pattern
- Serial Presence Detect with EEPROM
- Two On-DIMM Thermal Sensors
- Asynchronous Reset
- Bidirectional Differentially Buffered Data Strobes(DQS)
- SOUDIMM dimensions per JEDEC MO-310 maximum limits
- RoHS Compliant

DDR4 SPEED BIN Nomenclature

Module Standard	SDRAM Standard	Clock
DDR4-14900	DDR4-1866	933 MHz
DDR4-17000	DDR4-2133	1066 MHz
DDR4-19200	DDR4-2400	1200 MHz
DDR4-21300	DDR4-2667	1333 MHz
DDR4-25600 ¹	DDR4-3200	1600 MHz

Notes:

1. Contact Viking for availability date

DDR4 Timing Summary

MT/s	tCK (ns)	CAS Latency (tCK)	tRCD (ns)	tRP (ns)	tRAS (ns)	tRC (ns)	CL-tRCD-tRP
DDR4-1866	1.071	13	13.92	13.92	34	47.92	13-13-13
DDR4-2133	0.93	15	14.06	14.06	33	47.05	15-15-15
DDR4-2400	0.83	17	14.16	14.16	32	46.16	17-17-17
DDR4-2666	0.75	19	14.25	14.25	32	46.25	19-19-19

Notes:

- CL = CAS Latency, tRCD = Activate –to-Command Time, tRP = Precharge Time. Refer to Speed Bin tables for details.

44	VSS	88	CB4, NC	132	A2	176	VSS	220	DM6_n, DBI6_n, NC		

Notes:

- VPP is 2.5V DC
- A15 needed for 4GBit DRAM, A16 needed for 8GBit DRAM, A17 needed for 16GBit DRAM
- Only x8 and x16 DRAM support Data Mask (DM) and Data Bus Inversion (DBI). Only x8 DRAM support TDQS
- DM & DBI functions are supported with dedicated one pin labeled as DM_n/DBI_n
- The pin is bi-directional pin for DRAM. The DM_n/DBI_n pin is Active Low as DDR4 supports VDDQ reference termination.
- DM & DBI functions are programmable through DRAM Mode Register (MR). The MR bit location is bit A11 in MR1 and bit A12:A10 in MR5. Write operation: Either DM or DBI function can be enabled but both functions cannot be enabled simultaneously. When both DM and DBI functions are disabled, DRAM turns off its input receiver and does not expect any

Datasheet	4/26/2018
PS9FUxx72x8xx	Viking Technology
Revision E	Page 7 of 41

valid logic level. Read operation: Only DBI function applies. When DBI function is disabled, DRAM turns off its output driver and does not drive any valid logic level. DM & DBI functions are described in more detail on x8 based datasheets

PIN FUNCTION DESCRIPTION

Pin Name	Description	Pin Name	Description
A0-A17'	Register address input	SCL	I2C serial bus clock for SPD/TS and register
BA0, BA1	Register bank select input	SDA	I2C serial bus data line for SPD/TS and register
BG0, BG1	Register bank group select input	SA0-SA2	I2C slave address select for SPD/TS and register
RAS_n ²	Register row address strobe input	PAR	Register parity input
CAS_n ³	Register column address strobe input	VDD	SDRAM core power supply
WE_n ⁴	Register write enable input		
CS0_n, CS1_n, CS2_n, CS3_n	DIMM Rank Select Lines input		
CKE0, CKE1	Register clock enable lines input	VREFCA	SDRAM command/address reference supply
ODT0, ODT1	Register on-die termination control lines input	VSS	Power supply return (ground)
ACT_n	Register input for activate input	VDDSPD	Serial SPD/TS positive power supply
DQ0-DQ63	DIMM memory data bus	ALERT_n	Register ALERT_n output
CB0-CB7	DIMM ECC check bits	Vpp	DRAM Activation Power Supply
TDQS9_t-TDQS17_t	Data Buffer data strobes (positive line of differential pair)		
TDQS9_c- TDQS17_c	Data Buffer data strobes (negative line of differential pair)	RESET_n	Set Register and SDRAMs to a Known state
		EVENT_n	SPD signals a thermal event has occurred.
CK0_t, CK1_t	Register clock input (positive line of differential pair)	Vtt	SDRAM I/O termination supply
CK0_c, CK1_c	Register clocks input (negative line of differential pair)	RFU	Reserved for future use

Notes:

1. Address A17 is only valid for 16Gbit DRAM
2. RAS_n is a multiplexed function with A16. (A16 needed for 8Gbit DRAM)
3. CAS_n is a multiplexed function with A15. (A15 needed for 4Gbit DRAM)
4. WE_n is a multiplexed function with A14

Datasheet	4/26/2018
PS9FUxx72x8xxx	Viking Technology
Revision E	Page 8 of 41

Input/Output Functional Descriptions

Symbol	Type	Function
CK_t, CK_c	Input	Clock: CK_t and CK_c are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK_t and negative edge of CK_c.
CKE0, (CKE1)	Input	Clock Enable: CKE HIGH activates, and CKE Low deactivates, internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self-Refresh operation (all banks idle), or Active Power-Down (row Active in any bank). CKE is asynchronous for Self-Refresh exit. After VREFCA and VREFDQ have become stable during the power on and initialization sequence, they must be maintained during all operations (including Self-Refresh). CKE must be maintained high throughout read and write accesses. Input buffers, excluding CK, CK_c, ODT and CKE, are disabled during power-down. Input buffers, excluding CKE, are disabled during Self-Refresh.
CS0_n, (CS1_n)	Input	Chip Select: All commands are masked when CS_n is registered HIGH. CS_n provides for external Rank selection on systems with multiple Ranks. CS_n is considered part of the command code.
C0,C1,C2	Input	Chip ID: Chip ID is only used for 3DS for 2,4,8high stack via TSV to select each slice of stacked component. Chip ID is considered part of the command code.
ODT0, (ODT1)	Input	On Die Termination: ODT (registered HIGH) enables termination resistance internal to the DDR4 SDRAM. When enabled, ODT is only applied to each DQ, DQS_t, DQS_c and DM_n/DBI_n/TDQS_t,NU/TDQS_c (When TDQS is enabled via Mode Register A11=1 in MR1) signal for x8 configurations. For x16 configuration ODT is applied to each DQ, DQSU_c, DQSU_t, DQSL_t, DQSL_c, DMU_n, and DML_n signal. The ODT pin will be ignored if MR1 is programmed to disable RTT_NOM.
ACT_n	Input	Activation Command Input: ACT_n defines the Activation command being entered along with CS_n. The input into RAS_n/A16, CAS_n/A15 and WE_n/A14 will be considered as Row Address A16, A15 and A14.
RAS_n/A16, CAS_n/A15, WE_n/A14	Input	Command Inputs RAS_n/A16, CAS_n/A15 and WE_n/A14 (along with CS_n) define the command being entered. Those pins have multi function. For example, for activation with ACT_n Low, those are Addressing like A16,A15 and A14 but for non-activation command with ACT_n High, those are Command pins for Read, Write and other command defined in command truth table.
DM_n/DBI_n/ TDQS_t, (DMU_n/DBIU_n), (DML_n/DBIL_n)	Input/ Output	Input Data Mask and Data Bus Inversion: DM_n is an input mask signal for write data. Input data is masked when DM_n is sampled LOW coincident with that input data during a Write access. DM_n is sampled on both edges of DQS. DM is muxed with DBI function by Mode Register A10,A11,A12 setting in MR5. For x8 device, the function of DM or TDQS is enabled by Mode Register A11 setting in MR1. DBI_n is an input/output identifying whether to store/output the true or inverted data. If DBI_n is LOW, the data will be stored/output after inversion inside the DDR4 SDRAM and not inverted if DBI_n is HIGH. TDQS is only supported in x8.
BG0 - BG1	Input	Bank Group Inputs: BG0 - BG1 define to which bank group an Active, Read, Write or Precharge command is being applied. BG0 also determines which mode register is to be accessed during a MRS cycle. x4/8 have BG0 and BG1 but x16 has only BG0.

Input/Output Functional Descriptions (cont.)

Symbol	Type	Function
BA0 - BA1	Input	Bank Address Inputs: BA0 - BA1 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines if the mode register or extended mode register is to be accessed during a MRS cycle.
A0 - A17	Input	Address Inputs: Provided the row address for ACTIVATE Commands and the column address for Read/Write commands to select one location out of the memory array in the respective bank. (A10/AP, A12/BC_n, RAS_n/A16, CAS_n/A15 and WE_n/A14 have additional functions, see other rows. The address inputs also provide the op-code during Mode Register Set commands. A17 is only defined for the x4 configuration.
A10 / AP	Input	Auto-precharge: A10 is sampled during Read/Write commands to determine whether Autoprecharge should be performed to the accessed bank after the Read/Write operation. (HIGH: Autoprecharge; LOW: no Autoprecharge). A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by bank addresses.
A12 / BC_n	Input	Burst Chop: A12 / BC_n is sampled during Read and Write commands to determine if burst chop (on-the-fly) will be performed. (HIGH, no burst chop; LOW: burst chopped). See command truth table for details.
RESET_n	Input	Active Low Asynchronous Reset: Reset is active when RESET_n is LOW, and inactive when RESET_n is HIGH. RESET_n must be HIGH during normal operation. RESET_n is a CMOS rail to rail signal with DC high and low at 80% and 20% of VDD.
DQ	Input / Output	Data Input/ Output: Bi-directional data bus. If CRC is enabled via Mode register then CRC code is added at the end of Data Burst. Any DQ from DQ0~DQ3 may indicate the internal Vref level during test via Mode Register Setting MR4 A4=High. Refer to vendor specific datasheets to determine which DQ is used.
CB	Input / Output	Check Bit Input/ Output: Bi-directional ECC portion of data bus for x72 configurations
DQS_t, DQS_c, DQSU_t, DQSU_c, DQSL_t, DQSL_c	Input / Output	Data Strobe: output with read data, input with write data. Edge-aligned with read data, centered in write data. For x16, DQSL corresponds to the data on DQL0-DQL7; DQSU corresponds to the data on DQU0-DQU7. The data strobe DQS_t, DQSL_t, and DQSU_t are paired with differential signals DQS_c, DQSL_c, and DQSU_c, respectively, to provide differential pair signaling to the system during reads and writes. DDR4 SDRAM supports differential data strobe only and does not support single-ended.

Input/Output Functional Descriptions (cont.)

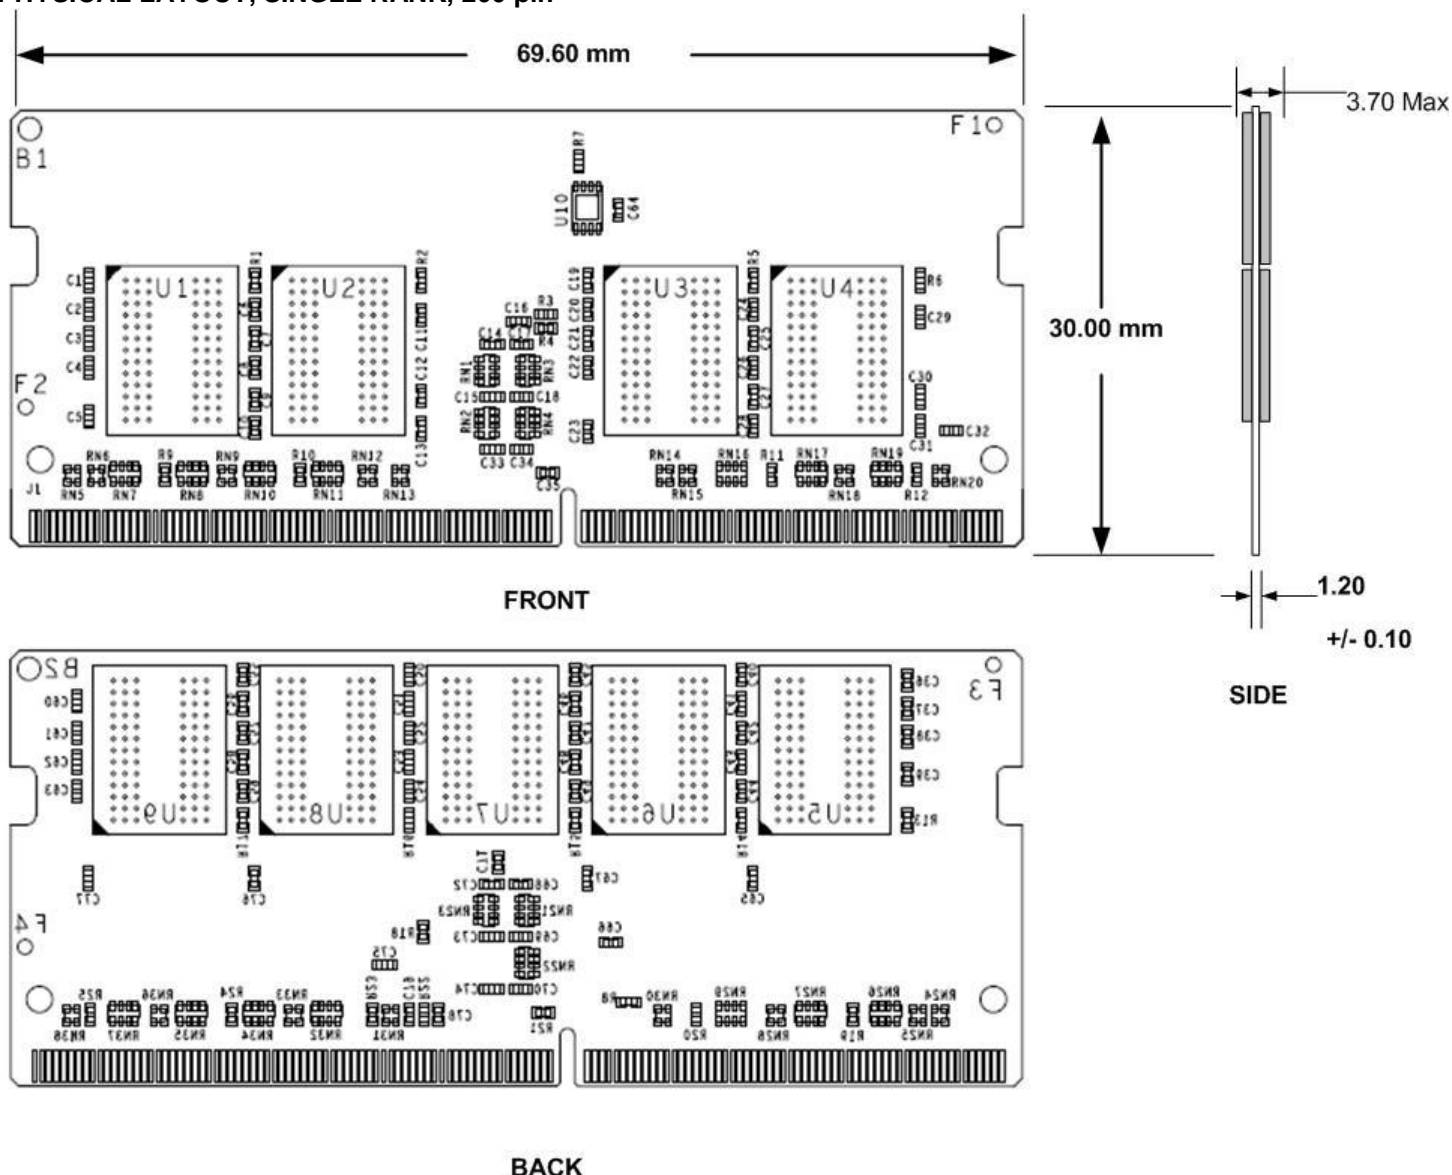

Symbol	Type	Function
ALERT_n	Output	Alert: It has multi functions such as CRC error flag, Command and Address Parity error flag. If there is error in CRC, then Alert_n goes LOW for the period time interval and goes back HIGH. IF there is error in Command Address Parity Check, then Alert_n goes LOW for relatively long period until on going DRAM internal recovery transaction to complete.
TEN	Input	Boundary Scan Mode Enable: Required on x16 devices and optional input on x4/x8 with densities equal to or greater than 8Gb. HIGH in this pin will enable boundary scan operation along with other pins. It is a CMOS rail to rail signal with DC high and low at 80% and 20% of VDD.
NC		No Connect: No internal electrical connection is present.
VDDQ	Supply	DQ Power Supply: 1.2 V +/- 0.06 V
VSSQ	Supply	DQ Ground
VDD	Supply	Power Supply: 1.2 V +/- 0.06 V
VSS	Supply	Ground
Vpp	Supply	DRAM Activation Power Supply: 2.5V (2.375V min , 2.75 max)
VREFCA	Supply	Reference voltage for CA
ZQ	Supply	Reference Pin for ZQ calibration

Note:

The input only pins (BG0-BG-1, BA0-BA1, A0-A17, ACT_n, RAS_n/A16, CAS_n/A15, WE_n/A14, CS_n, CKE, ODT, and RESET_n) do not supply termination.

DQ Internal Vref Specifications

Parameter	Symbol	Min	Typ	Max	Unit	NOTE
Vref Max operating point Range 1	Vref_max_R1	-	-	92%	VDDQ	1, 11
Vref Min operating point Range 1	Vref_min_R1	60%	-	-	VDDQ	1,11
Vref Max operating point Range 2	Vref_max_R2	-	-	77%	VDDQ	1, 11
Vref Min operating point Range 2	Vref_min_R2	45%	-	-	VDDQ	1,11
Vref Stepsize	Vref_step	0.50%	0.65%	0.80%	VDDQ	2
Vref Set Tolerance	Vref_set_tol	-1.625%	0.00%	1.63%	VDDQ	3,4,6
		-0.15%	0.00%	0.15%	VDDQ	3,5,7
Vref Step Time	Vref_time-long	-	-	150	ns	9
	Vref_time-Short	-	-	60	ns	8
Vref Valid tolerance	Vref_val_tol	-0.15%	0.00%	0.15%	VDDQ	10

Notes:

1. JESD8-24 specifies Vref to be 70% of VDDQ. Vref DC voltage referenced to VDDQ_DC. VDDQ_DC is 1.2V
2. Vref stepsize increment/decrement range. Vref at DC level.
3. $Vref_new = Vref_old + n * Vref_step$; n=number of step; if increment use "+"; If decrement use "-"
4. The minimum value of Vref setting tolerance= $Vref_new - 1.625\% * VDDQ$.
The maximum value of Vref setting tolerance= $Vref_new + 1.625\% * VDDQ$. For n>4
5. The maximum value of Vref setting tolerance= $Vref_new - 0.15\% * VDDQ$.
The maximum value of Vref setting tolerance= $Vref_new + 0.15\% * VDDQ$. For n&4 tbd
6. Measured by recording the min and max values of the Vref output over the range, drawing a straight line between those points and comparing all other Vref output settings to that line
7. Measured by recording the min and max values of the Vref output across 4 consecutive steps(n=4), drawing a straight line between those points and comparing all other Vref output settings to that line
8. Time from MRS command to increment of decrement one step size for Vref
9. Time from MRS command to increment of decrement more than one step size up to full range of Vref
10. Only applicable for DRAM component level test/characterization purpose.
Not applicable for normal mode of operation. Vref valid is to qualify the step times which will be characterized at the component level.
11. DRAM range1 or 2 set by MRS bit MR6,A6.

Datasheet	4/26/2018

Revision E	Page 16 of 41

OVERVIEW OF DDR4 SOUDIMM MODULE OPERATION

The DDR4 architecture is generally a point-to-point topology with a dedicated channel design. The highest system performance levels can be achieved with DDR4-2133 and beyond, when the system is configured as 1 SOUDIMM Per Channel (1DPC). DDR4 has more features than DDR3 with a pseudo-open drain (POD12) 1.2v I/O for the data channel, trained Vref, bank groups and write CRC. The POD12 interface only applies to the data channel. The address command channel behave like DDR3 using mid-point termination and mid-point Vref. The new bank group interleaving feature in DDR4 maximizes data transfer bandwidth.

DDR4 DRAM use pseudo-open drain (POD12) 1.2v drivers with Vdd terminations on DQ lines to increase data rates; unlike DDR3 DRAM that uses stub-series terminated logic drivers, The DRAM addressing scheme in DDR4 is organized into bank groups, Side A and Side B. The host DDR4 memory controller interleaves (multiplexes) among the bank groups to achieve high data rates. DDR4 architecture is a 8n prefetch with bank groups, including the use of two or four selectable bank groups. This will permit the DDR4 memory devices to have separate activation, read, write or refresh operations simultaneously underway in each of the unique bank groups to improve overall memory efficiency and bandwidth, especially when small memory granularities are used.

The data written to the SOUDIMM is read back the same way. However when writing to the internal registers with a "load mode" operation, a specific address is required. This requires the controller to know if the rank is mirrored or not. There is a bit assignment in the SPD that indicates whether the module has been designed with a mirrored feature or not.

DDR4 offers ECC recovery from command and parity errors to prevent the host system from crashing. The use of CRC parity is an optional feature on address command and data; (Error command blocking when parity enabled and post CA parity. If the SOUDIMM does not support CRC, the values of 0x00 will fill the CRC table. The new CA parity feature on the command/address bus provides a low-cost method of verifying the integrity of command and address transfers over a link, for all operations.

Some of the main attributes of DDR4 memory are:

- 1) Internally generated VrefDQ and Calibration.
VrefDQ is supplied by the DRAM internally.
VrefCA is supplied by the board.
- 2) The ACT_n activate pin replaces RAS#, CAS#, and WE# commands,
- 3) Alert_n for error checking
- 4) Bank group Interleaving
- 5) Improved training modes upon power-up
- 5) Nominal and dynamic ODT: Improvements to the ODT protocol and a new Park Mode allow for a nominal termination and dynamic write termination without having to drive the ODT pin
- 6) DQ bus geardown mode for 2667 Mhz data rates and beyond
- 7) External VPP at 2.5V (for wordline boost)
- 8) 1.2V VDD power with power-saving features that include MPSM Maximum Power Savings Mode, Low Power Auto Self Refresh, Temperature Controlled Refresh, Fine Granularity Refresh, and CMD/ADDT latency. DLL off mode.

Important Note:

Longer boot-up times may be experienced in certain situations due to controller initiated functions such as VrefDQ calibration, write leveling and other trainings for the SOUDIMM.

Notes:

- Refer to JEDEC documentation for detail of the control/status bits

DC OPERATING CONDITIONS AND CHARACTERISTICS

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit	Notes
Voltage on any pin relative to GND	Vin, Vout	-0.3 ~ 1.5	V	1,
Voltage on VDD supply relative to GND	VDD	-0.3 ~ 1.5	V	1,3
Voltage on VDDQ supply relative to GND	VDDQ	-0.3 ~ 1.5	V	1,3
Voltage on VPP supply relative to GND	VPP	-0.3 ~ 3.0	V	4
Module operating temperature (ambient)	T _{opr}	0 ~ 55	°C	1,5
Storage temperature	T _{stg}	-55 ~ +100	°C	1,2

Notes:

- Permanent device damage may occur if 'ABSOLUTE MAXIMUM RATINGS' are exceeded. Functional operation should be restricted to recommended operating condition.
Exposure to higher than recommended voltage for extended periods of time could affect device reliability. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability
- Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51- 2 standard.
- VDD and VDDQ must be within 300 mV of each other at all times and VREFCA must be not greater than 0.6 x VDDQ, When VDD and VDDQ are less than 500 mV; VREF may be equal to or less than 300 mV
- VPP must be equal or greater than VDD/VDDQ at all times
- Refer to JEDEC JC451 specification

DRAM Component Operating Temperature Range

Symbol	Parameter	Rating	Units	Note
T _{oper}	Normal Operating Temperature Range	0 to 85	°C	1,2
	Extended Temperature Range	85 to 95	°C	1,3

Notes:

- Operating Temperature TOPER is the case surface temperature on the center / top side of the DRAM. For measurement conditions, please refer to the JEDEC document JE51-2.
- The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0 - 85°C under all operating conditions.
- Some applications require operation of the DRAM in the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
 - Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9 μs. It is also possible to specify a component with 1X refresh (tREFI to 7.8μs) in the Extended Temperature Range. Please refer to the DIMM SPD for option availability.
 - If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 = 0b). DDR4 SDRAMs support Auto Self-Refresh and in Extended Temperature Range and please refer to component datasheet and/or the DIMM SPD for tREFI requirements in the Extended Temperature Range

tREFI by Device Density

Parameter	Symbol		2Gb	4Gb	8Gb	16Gb	Units
Average periodic refresh interval	tREFI	0°C ≤ T _{case} ≤ 85°C	7.8	7.8	7.8	7.8	μs
		85°C ≤ T _{case} ≤ 95°C	3.9	3.9	3.9	3.9	μs

Revision E	Page 19 of 41

AC & DC Operating Conditions

DC OPERATING CONDITIONS AND CHARACTERISTICS (POD12)

Symbol	Parameter	Rating			Units	Notes
		Min	Typ	Max		
VDD	Supply Voltage VDD: PC4:1.2V±5%,	1.14	1.2	1.26	v	1,2,3
VDDQ	Supply Voltage for Output. Values in () are at 70% of VDD	1.14 (0.798)	1.2 (0.84)	1.26 (0.882)	v	1
VPP	2.5V +10%, -5%	2.375	2.5	2.75	v	3
VDDSPD	@2.5V	2.2	-	3.6	v	

Notes:

1. JESD8-24 specifies Vref to be 70% of VDDQ. Under all conditions VDDQ must be less than or equal to VDD.
2. VDDQ tracks with VDD. AC parameters are measured with VDD and VDDQ tied together.
3. DC bandwidth is limited to 20MHz.,
4. POD12 1.2 V Pseudo Open Drain Interface has a VDDQ value of 1.2V but the reference voltage allows POD12 to be used with other VDDQ values. POD12 signals have pull-up-only parallel input termination and have an asymmetric output drive impedance. For example, if the output drivers were using a 60 ohm pull-up drive impedance then the pull-down drivers would be expected to produce a 40 ohm pull-down drive impedance. POD12 does not explicitly call for series termination resistors, so it is suitable for point-to-point as well as multi-drop stub environments which may require some additional termination.

DC CHARACTERISTICS, IDD CURRENTS

IDD DEFINITIONS

Symbol	Parameter
IDD0	One bank ACTIVATE-PRECHARGE current
IPP0	One bank ACTIVATE-PRECHARGE, Word Line Boost, IPP current
IDD1	One bank ACTIVATE-READ-PRECHARGE current
IDD2N	Precharge standby current
IDD2NT	Precharge standby ODT current
IDD2P	Precharge power-down current
IDD2Q	Precharge quiet standby current
IDD3N	Active standby current
IPP3N	Active standby IPP current
IDD3P	Active power-down current
IDD4R	Burst read current
IDDQ4R	Burst read IDDQ current
IDD4W	Burst write current
IDD5B	Burst refresh current (1x REF)
IPP5B	Burst refresh IPP current (1 x REF)
IDD6N	Self refresh current: Normal temperature range (0°C to +85°C)
IDD6E	Self refresh current: Extended temperature range (0°C to +95°C)
IDD6R	Self refresh current: Reduced temperature range (0°C to +45°C)
IDD6A	Auto self refresh current (25°C)
IDD6A	Auto self refresh current (45°C)
IDD6A	Auto self refresh current (75°C)
IDD7	Bank interleave read current
IPP7	Bank interleave read IPP current
IDD8	Maximum power-down current

Notes:

- 1) DDR4 IDD and IDDQ specs include the same DDR3 IDD and IDDQ specs with these exceptions:
 - a. IDD2P0 and IDD2P1 are replaced with a single IDD2P. There's no longer any difference in power for the DLL because of better DLL power management inside the DRAM device without any benefit for using slow exit.
 - b. IDD6 is renamed IDD6N Self Refresh Current: Normal Temperature Range
 - c. IDD6ET is renamed IDD6E Self-Refresh Current: Extended Temperature Range
 - d. IDD6TC is renamed IDD6AAut0 Self-Refresh Current
 - e. IDD8 is redefined from (optional) RESET Low Current to IDD8 Maximum Power Down Current, TBD
- 2) IDD values are an average (not peak) current drawn throughout the entire time that it takes to execute the set of conditions specified by JEDEC standards.
- 3) Consult with Viking for tools to help specify the Total Design Power (TDP)

I_{DD6} Specification

Symbol	Temperature Range	Value	Unit	Notes
IDD6N	0 - 85 °C	22	mA	3,4
IDD6E	0 - 95 °C	33	mA	4,5,6
IDD6R	0 - 45°C	10	mA	4,6,9
IDD6A	0 °C ~ Ta	9	mA	4,6,7,8
	Tb ~ Ty	10	mA	4,6,7,8
	Tz ~ TOPERmax	16	mA	4,6,7,8

Notes:

1. Some IDD currents are higher for x16 organization due to larger page-size architecture.
2. Max. values for IDD currents considering worst case conditions of process, temperature and voltage.
3. Applicable for MR2 settings A6=0 and A7=0.
4. Supplier data sheets include a max value for IDD6.
5. Applicable for MR2 settings A6=0 and A7=1. IDD6ET is only specified for devices which support the Extended Temperature Range feature.
6. Refer to the supplier data sheet for the value specification method (e.g. max, typical) for IDD6ET and IDD6TC
7. Applicable for MR2 settings A6=1 and A7=0. IDD6TC is only specified for devices which support the Auto Self Refresh feature.
8. The number of discrete temperature ranges supported and the associated Ta - Tz values are supplier/design specific. Temperature ranges are specified for all supported values of TOPER. Refer to supplier data sheet for more information.
9. Applicable for MR2 settings TBD. IDD6R is verified by design and characterization, and may not be subject to production test.

C_{CK}	Input capacitance, CK and CK#	0.2	0.8	0.2	0.8	TBD	TBD	pF	1,3
C_{DCK}	Input capacitance delta CK and CK#		0.05		0.05	TBD	TBD	pF	1,3,4
C_I	Input capacitance(CTRL, ADD, CMD pins only)	0.2	0.8	0.2	0.7	TBD	TBD	pF	1,3,6
C_{DI_CTRL}	Input capacitance delta(All CTRL pins only)	-0.1	0.1	-0.1	0.1	TBD	TBD	pF	1,3,7,8
$C_{DI_ADD_CMD}$	Input capacitance delta(All ADD/CMD pins only)	-0.1	0.1	-0.1	0.1	TBD	TBD	pF	1,2,9, 10
C_{ALERT}	Input/output capacitance of ALERT	0.5	1.5	0.5	1.5	TBD	TBD	pF	1,3
C_{ZQ}	Input/output capacitance of ZQ	0.5	1.5	0.5	1.5	TBD	TBD	pF	1,3,12

Notes:

1. This parameter is not subject to production test. It is verified by design and characterization. The silicon only capacitance is validated by de-embedding the package L & C parasitic. The capacitance is measured with VDD, VDDQ, VSS, VSSQ applied with all other signal pins floating. Measurement procedure tbd.
2. DQ, DM, DQS_T, DQS_C, TDQS_T, TDQS_C. Although the DM, TDQS_T and TDQS_C pins have different functions, the loading matches DQ and DQS
3. This parameter applies to monolithic devices only; stacked/dual-die devices are not covered here.
4. Absolute value $C_{K_T-CK_C}$
5. Absolute value of $C_{IO(DQS_T)}-C_{IO(DQS_C)}$
6. C_I applies to ODT, CS_n, CKE, A0-A17, BA0-BA1, BG0-BG1, RAS_n, CAS_n, WE_n.
7. C_{DI_CTRL} applies to ODT, CS_n and CKE
8. $C_{DI_CTRL} = C_{I(CTRL)}-0.5*(C_{I(CLK_T)}+C_{I(CLK_C)})$
9. $C_{DI_ADD_CMD}$ applies to, A0-A17, BA0-BA1, BG0-BG1, RAS_n, CAS_n, WE_n.
10. $C_{DI_ADD_CMD} = C_{I(ADD_CMD)}-0.5*(C_{I(CLK_T)}+C_{I(CLK_C)})$
11. $C_{DIO} = C_{IO(DQ,DM)}-0.5*(C_{IO(DQS_T)}+C_{IO(DQS_C)})$
12. Maximum external load capacitance on ZQ pin: tbd pF

DC and AC Specifications for the SMBus Interface

The specifications for the SMBus follow JEDEC standards.

MPSM Timing									
Command path disable delay upon MPSM entry	tMPED	tMOD(min) + tCPDED(min)	-				-		
Valid clock requirement after MPSM entry	tCKMPE	tMOD(min) + tCPDED(min)	-				-		
Valid clock requirement before MPSM exit	tCKMPX	tCKSRX(min)	-				-		
Exit MPSM to commands not requiring a locked DLL	tXMP	TBD	-				-		
Exit MPSM to commands requiring a locked DLL	tXMPDLL	tXMP(min) + tXSDDL(min)	-				-		
CS setup time to CKE	tMPX_S	TBD	-				-		
CS hold time to CKE	tMPX_H	TBD	-				-		
Calibration Timing									
Power-up and RESET calibration time	tZQinit	1024	-				-	nCK	
Normal operation Full calibration time	tZQoper	512	-				-	nCK	

Speed		DDR4-2400		DDR4-2667		DDR4-3200		Units	Note
Parameter	Symbol	MIN	MAX	MIN	MAX	MIN	MAX		
Normal operation Short calibration time	tZQCS	128	-				-	nCK	
Reset/Self Refresh Timing									
Exit Reset from CKE HIGH to a valid command	tXPR	max (5nCK,tRFC(min) + 10ns)	-				-		
Exit Self Refresh to commands not requiring a locked DLL	tXS	tRFC(min)+10ns	-				-		
SRX to commands not requiring a locked DLL in Self Refresh ABORT	tXS_ABORT(min)	tRFC4(min)+10ns	-				-		
Exit Self Refresh to ZQCL,ZQCS and MRS (CL,CWL,WR,RTP and Gear Down)	tXS_FAST (min)	tRFC4(min)+ 10ns	-				-		
Exit Self Refresh to commands requiring a locked DLL	tXSDLL	tDLLK(min)	-				-		
Minimum CKE low width for Self refresh entry to exit timing	tCKESR	tCKE(min)+1nCK	-				-		
Valid Clock Requirement after Self Refresh Entry (SRE) or Power-Down Entry (PDE)	tCKSRE	max(5nCK,10ns)	-				-		
Valid Clock Requirement after Self Refresh Entry (SRE) or Power-Down when CA Parity is enabled	tCKSRE_PAR	max (5nCK,10ns)+PL	-				-		
Valid Clock Requirement before Self Refresh Exit (SRX) or Power-Down Exit (PDX) or Reset Exit	tCKSRX	max(5nCK,10ns)	-				-		
Power Down Timing									
Exit Power Down with DLL on to any valid command; Exit Precharge Power Down with DLL frozen t commands not requiring a locked DLL	tXP	max (4nCK,6ns)	-				-		
Exit Precharge Power Down with DLL frozen to commands requiring a locked DLL	tXPDLL	max (10nCK, 24ns)	-				-		3
CKE minimum pulse width	tCKE	max (3nCK, 5ns)	-				-		32,33
Command pass disable delay	tCPDED	4	-				-		
Power Down Entry to Exit Timing	tPD	tCKE(min)	9*tREFI				9*tREFI		6
Timing of ACT command to Power Down entry	tACTPDEN	2	-				-		7
Timing of PRE or PREA command to Power Down entry	tPRPDEN	2	-				-		7
Timing of RD/RDA command to Power Down entry	tRDPDEN	RL+4+1	-				-	nCK	
Timing of WR command to Power Down entry (BL8OTF, BL8MRS, BC4OTF)	tWRPDEN	WL+4+(tWR/ tCK(avg))	-				-	nCK	4
Timing of WRA command to Power Down entry (BL8OTF, BL8MRS, BC4OTF)	tWRAPDEN	WL+4+WR+1	-				-	nCK	5
Timing of WR command to Power Downentry (BC4MRS)	tWRPBC4DEN	WL+2+(tWR/ tCK(avg))	-				-	nCK	4
Timing of WRA command to Power Down entry (BC4MRS)	tWRAPBC4DEN	WL+2+WR+1	-				-	nCK	5
Timing of REF command to Power Down entry	tREFPDEN	2	-				-	nCK	7,8
Timing of MRS command to Power Down entry	tMRSPDEN	tMOD(min)	-				-		
PDA Timing									
Mode Register Set command cycle time in PDA mode	tMRD_PDA	max(16nCK,10ns)	-	max(16nCK,10ns)	-	max(16nCK,10ns)	-		
Mode Register Set command update delay in PDA mode	tMOD_PDA	tMOD		tMOD		tMOD			
ODT Timing									
Asynchronous RTT turn-on delay (Power-Down with DLL frozen)	tAONAS	1	9					ns	
Asynchronous RTT turn-off delay (Power-Down with DLL frozen)	tAOFAS	1	9					ns	
RTT dynamic change skew	tADC	0.3	0.7					tCK(avg)	
Write Leveling Timing									
First DQS_t/DQS_n rising edge after write leveling mode is programmed	tWLMRD	40	-					nCK	13
DQS_t/DQS_n delay after write leveling mode is programmed	tWLDQSEN	25	-					nCK	13

Speed		DDR4-2400		DDR4-2667		DDR4-3200		Units	Note
Parameter	Symbol	MIN	MAX	MIN	MAX	MIN	MAX		
Write leveling setup time from rising CK_t, CK_c crossing to rising DQS, tDQS_n crossing	tWLS	0.13	-					tCK(avg)	
Write leveling hold time from rising DQS, tDQS_n crossing to rising CK_t, CK_c crossing	tWLH	0.13	-					tCK(avg)	
Write leveling output delay	tWLO	0	9.5					ns	
Write leveling output error	tWLOE							ns	
CA Parity Timing									
Commands not guaranteed to be executed during this time	tPAR_UNKNOWN	-	Max(2nCK,3ns)						
Delay from errant command to ALERT_n assertion	tPAR_ALERT_ON	-	PL+6ns						
Pulse width of ALERT_n signal when asserted	tPAR_ALERT_PW	72	144					nCK	
Time from when Alert is asserted till controller must start providing DES commands in Persistent CA parity mode	tPAR_ALERT_RSP	-	64					nCK	
Parity Latency [1715.64, JC42.3C]	PL	5						nCK	
CRC Error Reporting									
CRC error to ALERT_n latency	tCRC_ALERT	-	13					ns	
CRC ALERT_n pulse width	CRC_ALERT_PW	6	10					nCK	
Write recovery time when CRC and DM are enabled	tWR_CRC_DM	tWR+max (5nCK,3.75ns)		-				ns	10
delay from start of internal write transaction to internal delay from start of internal write transaction to internal read command for different bank group with both CRC and DM enabled	tWTR_S_C RC_DM	tWTR_S+max (5nCK,3.75ns)		-				ns	11
delay from start of internal write transaction to internal delay from start of internal write transaction to internal read command for same bank group with both CRC and DM enabled	tWTR_L_C RC_DM	tWTR_L+max (5nCK,3.75ns)		-				ns	12
Geardown timing									
Exit RESET from CKE HIGH to a valid MRS geardown (T2/Reset)	tXPR_GEAR	tXPR		tXPR					
CKE HIGH Assert Geardown Enable time(T2/CKE)	tXS_GEAR	tXS		tXS					
MRS command to Sync pulse time(T3)	tSYNC_GEAR	tMOD(min)+4nCK		tMOD(min)+4nCK					28
Sync pulse to First valid command(T4)	tCMD_GEAR			tMOD		tMOD			28
Geardown setup time	tGEAR_setup			2	-	2	-	nCK	
Geardown hold time	tGEAR_hold			2	-	2	-	nCK	
tREFI									
tRFC1 (min)	2Gb	160	-	160	-	160	-	ns	
	4Gb	260	-	260	-	260	-	ns	
	8Gb	350	-	350	-	350	-	ns	
	16Gb	TBD by JEDEC board spec)		TBD	-	TBD	-	ns	
tRFC2 (min)	2Gb	110	-	110	-	110	-	ns	
	4Gb	160	-	160	-	160	-	ns	
	8Gb	260	-	260	-	260	-	ns	
	16Gb	TBD by JEDEC board spec)		TBD	-	TBD	-	ns	
tRFC4 (min)	2Gb	90	-	90	-	90	-	ns	
	4Gb	110	-	110	-	110	-	ns	
	8Gb	160	-	160	-	160	-	ns	
	16Gb	TBD by JEDEC board spec)		TBD	-	TBD	-	ns	

Notes:

- Start of internal write transaction is defined as follows:
For BL8 (Fixed by MRS and on-the-fly): Rising clock edge 4 clock cycles after WL.
For BC4 (on-the-fly): Rising clock edge 4 clock cycles after WL.
For BC4 (fixed by MRS): Rising clock edge 2 clock cycles after WL.
- A separate timing parameter will cover the delay from write to read when CRC and DM are simultaneously enabled
- Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
- tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR/tCK to the next integer.
- WR in clock cycles as programmed in MR0.
- tREFI depends on TOPER.
- CKE is allowed to be registered low while operations such as row activation, precharge, autoprecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
- Although CKE is allowed to be registered LOW after a REFRESH command once tREFPDEN(min) is satisfied, there are cases where additional time such as tXPDLL(min) is also required. See 0.1.3 "Power-Down clarifications - Case 2" in RB11112 .

Datasheet	4/26/2018
PS9FUxx72x8xxx	Viking Technology
Revision E	Page 40 of 41

- DQ Receiver(Rx) compliance mask
- 9. For these parameters, the DDR4 SDRAM device supports $t_{nPARAM}[nCK]=RU\{t_{PARAM}[ns]/t_{CK}(avg)[ns]\}$, which is in clock cycles assuming all input clock jitter specifications are satisfied
- 10. When CRC and DM are both enabled, $t_{WR_CRC_DM}$ is used in place of t_{WR} .
- 11. When CRC and DM are both enabled $t_{WTR_S_CRC_DM}$ is used in place of t_{WTR_S} .
- 12. When CRC and DM are both enabled $t_{WTR_L_CRC_DM}$ is used in place of t_{WTR_L} .
- 13. The max values are system dependent.
- 14. DQ to DQS total timing per group where the total includes the sum of deterministic and random timing terms for a specified BER. BER spec and measurement method are tbd.
- 15. The deterministic component of the total timing. Measurement method tbd.
- 16. DQ to DQ static offset relative to strobe per group. Measurement method tbd.
- 17. This parameter will be characterized and guaranteed by design.
- 18. When the device is operated with the input clock jitter, this parameter needs to be derated by the actual $t_{jit(per)}_{total}$ of the input clock. (output Deratings are relative to the SDRAM input clock). Example tbd.
- 19. DRAM DBI mode is off.
- 20. DRAM DBI mode is enabled. Applicable to x8 and x16 DRAM only.
- 21. t_{QSL} describes the instantaneous differential output low pulse width on $DQS_t - DQS_c$, as measured from on falling edge to the next consecutive rising edge
- 22. t_{QSH} describes the instantaneous differential output high pulse width on $DQS_t - DQS_c$, as measured from on falling edge to the next consecutive rising edge
- 23. There is no maximum cycle time limit besides the need to satisfy the refresh interval t_{REFI}
- 24. $t_{CH}(abs)$ is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge
- 25. $t_{CL}(abs)$ is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge
- 26. Total jitter includes the sum of deterministic and random jitter terms for a specified BER. BER target and measurement method are tbd.
- 27. The deterministic jitter component out of the total jitter. This parameter is characterized and guaranteed by design.
- 28. This parameter has to be even number of clocks
- 29. When CRC and DM are both enabled, $t_{WR_CRC_DM}$ is used in place of t_{WR} .
- 30. When CRC and DM are both enabled $t_{WTR_S_CRC_DM}$ is used in place of t_{WTR_S} .
- 31. When CRC and DM are both enabled $t_{WTR_L_CRC_DM}$ is used in place of t_{WTR_L} .
- 32. After CKE is registered LOW, CKE signal level shall be maintained below V_{ILDC} for t_{CKE} specification (Low pulse width).
- 33. After CKE is registered HIGH, CKE signal level shall be maintained above V_{IHDC} for t_{CKE} specification (HIGH pulse width).
 $UI=t_{CK}(avg).min/2$
